

ARTEFACT SEARCH SYSTEM

ABSTRACT

PROBLEM STATEMENT:

Any market place needs to provide its consumer a mechanism to list all the available artefacts and provide an easy search and filter facility. This takes some time to develop and try out the business aspects of the specific domain.

This search system is a solution that provides the management of artefacts through the application development process. The model combines information from different databases. Each database is meant for a particular category and their related set of data respectively.

This cloud based system provides a listing for any market place in a very quick manner at the click of a few buttons and few configurations. It also intends to provide a suggestion/recommendation feature for making the user's life easy in finding the right artefacts as per their taste and requirements. This reduces the time to market and time to develop a business idea into a reality.
